

Write your own proof of the statement:

"For any sets A , B , C , if B is a subset of C then $A - (B \cup C) = A - C$."

Upload your proof to Canvas by the start of class on Tuesday.

Let $x \in B$, also $x \in C$ because $B \subset C$

Since $B \cup C$ would mean $x \in B$ or $x \in C$,
This is already the case.

$A - (B \cup C)$ would mean $x \notin A$ since $x \in B$
 $A - C$ would also mean $x \notin A$ since $x \in C$.
By definition of sets, $A - (B \cup C) = A - C$
